## **DSSTox Field Definition File:**

## EPA Fathead Minnow Acute Toxicity Database (EPAFHM)

(last updated 15 February 2008)

**Description:** Information in this file is intended to provide a minimum level of annotation to the DSSTox SDF (Structure Data Format) file created for the EPA Fathead Minnow Acute Toxicity Database (EPAFHM) obtained from the Source website. For further explanation of Source-specific fields, a user is encouraged to consult the listed references. Additional information is provided on the DSSTox EPAFHM SDF Download Page <a href="http://www.epa.gov/ncct/dsstox/sdf\_epafhm.html">http://www.epa.gov/ncct/dsstox/sdf\_epafhm.html</a>. A number of modifications in fields (and allowable entries) were made to the original EPA Fathead Minnow database to improve consistency in notations, eliminate the need for table addendums, and facilitate use of the DSSTox SDF files in relational searching applications. All modifications are documented in the **Comments** section of the table below. In the course of creating the DSSTox SDF files, it was noted that the Source EPA Fathead Minnow database included a single LC50 test result rather than a geometric mean when multiple (2-10) bioassays were performed on a single chemical. Replicate bioassays were conducted on 98 chemicals in the database. In order to align with the Main Citation - Appendix 2, these replicate experiments are not listed separately in the DSSTox EPAFHM SDF file; rather a single geometric mean of replicate LC50 values for each of the 98 chemicals is reported. As a result of this finding, specific listings of all 137 replicate LC50 experiments for the 98 chemicals were added to the original Source EPA Fathead Minnow database.

Description of **DSSTox Standard Chemical Fields** can be found in the Central Field Definition Table located at: http://www.epa.gov/ncct/dsstox/CentralFieldDef.html

The first section of the Table below lists the **DSSTox Standard Toxicity Fields** employed for this database, followed by the **EPAFHM Source-Specific Fields** containing the toxicity information particular to EPAFHM. The **Field Type** indicates the type of the field, such as numeric, integer, defined text, memo, etc. All **Units** and **Descriptions** are extracted from Source reference materials unless otherwise noted. **Allowable Entries** lists allowed field entries occurring in EPAFHM, separated by slashes for exclusive entries (i.e., cannot occur with another entry) and semicolons or spaces for non-exclusive entries (i.e., can occur with other values). These are defined and explained in the **Description** section.

Source Website: <a href="http://www.epa.gov/med/databases/fathead\_minnow.htm">http://www.epa.gov/med/databases/fathead\_minnow.htm</a>

**Source Contact:** Scientific questions pertaining to the EPAFHM database should be directed to Chris Russom, Mid-continent Ecology Division, National Health & Environmental Effects Research Laboratory, US EPA, Duluth, MN; email: russom.chris@epa.gov

**Main Citation:** Publications reporting use of the DSSTox SDF file for the EPA Fathead Minnow database are asked to list the full DSSTox file name, including date stamp, and to cite as primary reference the following:

Russom, C.L., S.P. Bradbury, S.J. Broderius, D.E. Hammermeister, and R.A. Drummond (1997) Predicting modes of action from chemical structure: Acute toxicity in the fathead minnow (*Pimephales promelas*). *Environmental Toxicology and Chemistry* 16(5): 948-967. \*

\*pdf of Main Citation can be downloaded from EPAFHM SDF Download Page at the central DSSTox website: http://www.epa.gov/ncct/dsstox/sdf\_epafhm.html

## **SDF Usage Notes:**

Each DSSTox SDF file contains a single **STRUCTURE** field. For each chemical record, the **STRUCTURE** field entry directly corresponds to the content of the **STRUCTURE\_...** fields. The **STRUCTURE\_Shown** field documents the relationship between what is displayed in the **STRUCTURE** field and the actual tested chemical substance, i.e. **TestSubstance\_...** fields, with the latter corresponding directly to the toxicity data field entries. Commercial chemical relational database (CRD) applications may automatically insert one or more structure identifier fields upon import or export of an SDF file (e.g., Formula, FW or Mol\_ID), fields that may augment or duplicate one or more of the DSSTox Standard Chemical Fields. Users are cautioned that fields containing null values in the first record of the

SDF will be reordered upon import into most applications; for this reason, the word "blank" has been inserted into null fields in Record 1 of DSSTox SDF files and can be deleted after SDF import. Users are additionally cautioned that some fields (STRUCTURE\_SMILES and STRUCTURE\_InChI, in particular) may exceed the 200 character limit specified in the MDL CTFiles SDF standard (see <a href="http://www.epa.gov/ncct/dsstox/MoreonSDF.html">http://www.epa.gov/ncct/dsstox/MoreonSDF.html</a>), and that some CRD applications may insert a line break or truncate these fields upon SDF import or export. Finally, CRD application-specific molecular header information in the SDF file is deleted in the final DSSTox SDF files; users running CRD applications requiring a unique molecule header upon import of the SDF can specify either DSSTox\_RID or the DSSTox\_FileID be used. Upon SDF import, DSSTox\_CID can be used to identify and manage chemical structure duplicates and DSSTox\_Generic\_SID can be used to identify common Test Substances across and within DSSTox files (similar to CASRN-substance, but available for all DSSTox substances and further distinguishes among different purity/grade substances).

As an MS Word document, the following table is best viewed onscreen using either Normal or Web Layout View in Landscape page orientation.

Field Name	Field Type	Units	Allowable Entries	Description	Comments		
	DSSTox Standard Toxicity Fields						
Study Type (no spaces)	defined text		Acute Toxicity	Field is used to label all records in the database, generally with the same entry, and is designed to facilitate record identification for cross-database structure searching. Field entry refers to the main type of toxicity study for which data is represented in the database.	Field names and content are being coordinated with the public ToxML standardization effort.		
Endpoint	defined text		LC50	Field is used to label all records in the database, generally with the same entry, and is designed to facilitate record identification for cross-database structure searching. Field entry refers to the type of toxicity measure represented within the database.	Field names and content are being coordinated with the public ToxML standardization effort.		
Species	defined text		fathead minnow	Field is used to label all records in the database, generally with the same entry, and is designed to facilitate record identification for cross-database structure searching. Field entry refers to the species of animal(s) listed in the data record and used in the toxicity study or studies.	Field names and content are being coordinated with the public ToxML standardization effort.		
		-		EPAFHM Source-Specific Fields			
ChemClass_FHM	defined text		Alkanes/ Alkenes/ Saturated Hydrocarbons/ Unsaturated Hydrocarbons/ Basic Ethers/ Diphenyl Ethers/ Cyclic Ethers/ Basic Alcohols/ Alkene Alcohols/	Standard organic chemical class designations of the sort used in traditional QSAR studies. These class designations are only provided for information purposes in EPAFHM and were not used in the construction of Mode-of-action (MOA) classes or derivation of quantitative structure-activity relationships (QSARs) for this study.	To facilitate use of EPA Fathead Minnow database in a relational format, we have replaced the original field "CODE" with new field "ChemClass FHM", which contains the organic chemical class referenced in the "CODE" field and listed in a Table 2 addendum in the original EPA Fathead Minnow database.  DSSTox field entries exactly correspond to original EPA Fathead Minnow database		
			Diols/ Aldehydes/ Basic Ketones/ beta Diketones/		original EPA Fathead Minnow database CODE Table 2 entries with the exception that commas are deleted from Primary, Secondary, Tertiary, aliphatic and aromatic		

Cyclic Ketones/ Carboxylic Acids/ Basic Esters/ Phthalates/ Amides/ Acrylates/ Nitriles/ Primary aliphatic amines/ Secondary aliphatic amines/ Tertiary aliphatic amines/ Primary aromatic amines/	amines class names, and hyphens are deleted from 5-membered ring aliphatics and aromatics, beta-Diketones, hetero-atom compounds, and DEAS-complex structures class names.  DEAS stands for "Drug Enforcement Agency Structures", a broad functional categorization.

CLOGP	numeric		#	Logarithm of the octano/water partition coefficient (LogP) computed using the semiempirical fragment-based method applied in the CLOGP software [2], unless "measured LogP" appears in MLOGP field in which case the measured LogP value is provided in the <b>CLOGP</b> field from the STARLIST database of CLOGP.	
MLOGP	defined text		measured LogP/ blank	"measured LogP" indicates CLOGP field value is obtained from the STARLIST database of experimentally measured LogP values provided in the CLOGP application [2];	
				"blank" or null entry indicates the CLOGP field value is computed from the CLOGP semiempirical fragment- based method.	
LC50_mg	numeric	mg/l	#/ blank	96 hr LC50 (concentration producing lethality in 50% of test animals after 96 hours exposure) in mg/l. Calculated using Spearman-Karber method [3]. Geometric mean of LC50s presented if more than one bioassay conducted for the chemical;  "blank" or null entry indicates no mortality, or less than 50% mortality observed at 96hr.	If insufficient mortality was observed, LC50 was assigned a value of -99 in the original EPA Fathead Minnow database. To avoid problems when log(LC50) is used in QSAR, we convert these to <i>blank</i> entry in LC50 field. Replicate experiments used to compute geometric mean LC50 values for 98 chemicals are listed in revised EPA Fathead Minnow database located at Source website. Geometric mean LC50 value for pentachlorophenol is reported in DSSTox SDF.
LC50_mmol	numeric	mmol/l	#/ blank	Conversion of LC50_mg to mmol units:  LC50_mmol = LC50_mg / STRUCTURE_MolecularWeight;  "blank" or null entry indicates no mortality, or less than 50% mortality observed at 96hr.	Field new to v3a.
ActivityOutcome _EPAFHM	defined text		active/ inconclusive/ inactive/	Categorical activity measure based on reported LC50_mg:  "active" if an LC50_mg is reported;  "inconclusive" if only partial mortality was reached at the highest tested dose; and  "inactive" if no mortality at the highest tested dose.	Summary activity for use in PubChem and structure-activity relationship studies.  New field added to v4b.
ActivityScore_ EPAFHM	integer		INTEGER [0-100]	Mapping of LOG10 (1/LC50_mmol) activity values spanning activity range [MIN, MAX] onto Integer 1-100 Activity range, where 100 is highest potency and 1 is lowest.	Summary activity ranking for use in PubChem and structure-activity relationship studies.
				If ActivityOutcome_EPAFHM is "active:  ActivityScore = 100 * INTEGER[(log10(1/ LC50_mmol) - MIN)/(MAX – MIN)].  If ActivityOutcome_EPAFHM is "inactive" or	New field added to v4b.

"inconclusive":	
ActivityScore = 0.	

LC50_Ratio	numeric	#/ blank	Used for dose-response assessments in the estimation of Mode-of-Action (MOA); entry is ratio of 24hr LC50 to 96hr LC50 unless otherwise noted (for ratios of 48hr or 72hrs to 96hrs) in LC50_Note field;  "blank" or null entry indicates ratio was not computed with reason provided in LC50_Note field.	Text codes (r48, r72, NR) were substituted for the following symbol codes used in the original EPA Fathead Minnow database:  * = 48h/96h ratio = r48  # = 72h/96h ratio = r72  ** = LC50 obtained at 96 h = NR  NM, NT not defined in original EPAFHM documentation  In case of replicate experiments, ratio for a single replicate is reported that approximately represents group.  Replaces LC50RATIO field name.  Abbreviations used previously have been expanded and moved to LC50_Note field:  r48 = 48hr to 96hr LC50_Ratio  r72 = 72hr to 96hr LC50_Ratio  NM = non-monotonical pattern of death (i.e. more deaths at lower concentrations)  NR = LC50 obtained only at 96hr so no LC50_Ratio determined  NT = not toxic in 96hr exposure so no LC50_Ratio not determined  ND = LC50_Ratio not determined
LC50_Note	defined text	Text	Comments regarding the LC50_mg value and LC50_Ratio determination; Comments pertain to exceptional situations, e.g., where: 50% mortality could not be achieved at saturation concentrations, non-monotonical pattern of death was observed (i.e., more deaths at lower concentrations than at higher concentrations), or exceptions were made in terms of pH or mixtures;  If more than one replicate bioassay, number of experiments contributing to calculation of the geometric mean LC50 is specified;  If LC50_Ratio was other than 24hr to 96 hr LC50 ratio, or was not computed, explanation is provided here.	Replaces REMARKS field in original EPA Fathead Minnow database; eliminate use of abbreviations for mortality and saturation. When more than one bioassay was performed on chemical, note refers to single test result. A note was added to the DSSTox SDF specifying the number of experiments (2-10) contributing to calculation of the geometric mean LC50. Replaces LC50NOTE field name. Replaces text footnotes in LC50_Ratio field.
MOA	defined text	Baseline narcosis; Polar narcosis/ Acrylate and ester narcosis/ Uncoupler of oxidative phosphorylation/ Acetylcholinesterase	Mode-of-action (MOA) of chemical assigned by authors of study based on joint toxic action studies, establishment of toxicodynamic profiles, and behavioral and dose-response interpretation of 96 hr LC50 tests.  Further description of MOA categories is provided in Main Citation (Russom et al., 1997).	Field content provided in Table 3 addendum to original EPA Fathead Minnow database, referenced to MOA_NUM codes. The latter field and codes, used by the authors for a specific application, were deemed unnecessary for inclusion in the DSSTox SDF.

inhibition/	Original MOA field entries in the EPA
Respiratory blocker	Fathead Minnow database (e.g.,
or inhibitor/	REACTIVE_1, _2, _3, _4) corresponding to
Electrophile or	a single MOA with different levels of
proelectrophile	confidence (A,B,C,D) have been collapsed
reactivity/	into a single MOA field for the DSSTox SDF
Central nervous	(e.g., REACTIVE). The level of confidence
system seizure or	is specified in a newly added field,
stimulant/	MOA_Confidence. In addition, some
Neurodepressant/	common MOA categories that were listed
MOA not determined	separately for chemical classes were
due to insufficient	combined into the single MOA category and
evidence/	symbols in MOA names were eliminated:
MOA not determined	NARC_ACRYLATE = NARCOSIS III
due to conflicting	NARCO_ESTER = NARCOSIS III
evidence/	NARC_AMINE = NARCOSIS II
MOA not determined	NARCOSIS_I&II = NARCOSIS I and II
either due to lack	
of toxicity at	EMPTY = ND
saturation or late	
test result/	EPAFHM_v4a eliminates abbreviations for
	MOA Categories:
	NARCOSIS I = Baseline narcosis
	NARCOSIS II = Polar narcosis
	NARCOSIS III = Narcosis III primarily
	observed in esters and some
	acrylates
	NARCOSIS I and II = Identified as both
	Narcosis I & II
	UNCOUPLER = Uncoupler of oxidative
	phosphorylation
	ACHE = Acetylcholinesterase inhibition
	BLOCKER = Respiratory blocker/inhibitor
	REACTIVE = Electrophile/proelectrophile
	reactivity
	NEUROTOX = Central nervous system
	seizure/stimulant
	NEURODEP = Neurodepressant
	UNSURE = MOA could not be
	determined - insufficient evidence
	MIXED = MOA could not be determined -
	conflicting evidence
	~
	ND = MOA was not determined either
	because the chemical was not toxic at
	saturation or the test result was
	obtained after the MOA analysis was
	conducted.

MOA_Confidence	defined text	High/ High-Moderate/ Moderate/ Low/	Level of confidence placed in MOA classification based on available evidence:  High = FishActuteToxSyndrome, joint toxicity (MOA_MixtureTest) determination and/or chemical-specific literature confirmation;  High-Moderate = FishBehaviorTest, LC50_Ratio, and ExcessToxicityIndex value all consistent with structurally similar chemical with MOA assignment and "High" level confidence; also if LC50_Ratio and TOXINDEX consistent with prototypical compound in MOA group;  Moderate = less than 3 "High-Moderate" components, but additional supporting information available (such as concentration/response slope, behavior comments, chemical similarity to prototypical compound);  Low = no confidence in MOA classification due to insufficient data;  "blank" or null entry indicates no MOA assigned hence no level of confidence listed.	Field added to DSSTox SDF to accommodate information that had previously been combined into MOA field in original EPA Fathead Minnow database, e.g.:  MOA=REACTIVE_1 converts to MOA=REACTIVE, MOA_Confidence =A  MOA=REACTIVE_2 converts to MOA=REACTIVE, MOA_Confidence=B etc.  Previous ranking A-D replaced with High (A), High-Moderate (B), Moderate (C), Low (D).
MOA_Mixture Test (no spaces)	defined text	Baseline narcosis; Polar narcosis/ Uncoupler of oxidative phosphorylation/ Respiratory blocker or inhibitor/	If a mixture test was conducted and the chemical was additive with a chemical of known MOA as described by Broderius et al. [4], an MOA was assigned (see MOA field definitions);  "blank" or null entry indicates no mixture test was performed.	Replaces MIXINDEX field in original EPA Fathead Minnow database, with numerical index entry replaced by the corresponding MOA text as follows:  0 = blank (no mixture test)  1 = NARCOSIS I  2 = NARCOSIS II  12 = NARCOSIS I and II  3 = UNCOUPLER  4 = BLOCKER  EPAFHM_v4a eliminates abbreviations for MOA Categories:  NARCOSIS I = Baseline narcosis NARCOSIS I = Polar narcosis NARCOSIS I and II = Identified as both Narcosis I & II  UNCOUPLER = Uncoupler of oxidative phosphorylation BLOCKER = Respiratory blocker/inhibitor
ExcessToxicity Index (no spaces)	numeric	#	Ratio of the predicted toxicity of the compound using Baseline narcosis (Narcosis I) QSAR equation of Veith et al. [5]:  Log molar LC50 = -0.94 log <i>P</i> + log(0.000068* <i>P</i> +1) - 1.25  ( <i>P</i> =octanol/water partition coeff), divided by the actual LC50, used as a measure of excess toxicity. Values greater than 10 are considered indicative of compounds not acting by Baseline narcosis (Narcosis I) mode of	2230.12. (= 1.00p.natory bioontofinifilation

_			
		action. Contributes to determination of level of	
		confidence of MOA assignment.	

FishAcuteTox Syndrome (no spaces)	defined text	Baseline narcosis/ Polar narcosis/ Uncoupler of oxidative phosphorylation/ Respiratory blocker or inhibitor / Electrophile or proelectrophile reactivity / Acetylcholinesterase inhibition/ blank	If a fish acute toxicity syndrome (FATS) test was conducted using rainbow trout as described by McKim et al. [6,7], the MOA that was determined from that test is listed. FATS MOA assignments consistent with MOA assignment of chemical from other indicators for fathead minnow provide the highest level of confidence (A) to the chemical MOA assignment (see MOA field definitions); "blank" or null entry indicates no FATS test was performed.	MOA codes used in the original EPA Fathead Minnow database field have been replaced with the corresponding MOA name in DSSTox SDF: N-1 = NARCOSIS I N-2 = NARCOSIS II UNC = UNCOUPLER RBK = (Respiratory) BLOCKER IRR = (Irritants) REACTIVE ACH = ACHE  EPAFHM_v4a eliminates abbreviations for MOA Categories: NARCOSIS I = Baseline narcosis NARCOSIS II = Polar narcosis NARCOSIS III = Narcosis III primarily observed in esters and some acrylates NARCOSIS I and II = Identified as both Narcosis I & II UNCOUPLER = Uncoupler of oxidative phosphorylation ACHE = Acetylcholinesterase inhibition BLOCKER = Respiratory blocker/inhibitor REACTIVE = Electrophile/proelectrophile reactivity NEUROTOX = Central nervous system seizure/stimulant NEURODEP = Neurodepressant UNSURE = MOA could not be determined - insufficient evidence MIXED = MOA could not be determined - conflicting evidence ND = MOA was not determined either because the chemical was not toxic at saturation or the test result was obtained after the MOA analysis was conducted.
FishBehaviorTest (no spaces)	defined text	TYPE I Depressed motor activity/ TYPE II Hyperactive/ TYPE III Spontaneous motor activity/ Conflicting information; Tested in electronic	Behavior signs of stress were identified for fathead minnows exposed to toxicants and were used to classify chemicals into three behavioral syndromes as described by Drummond and Russom [8]. These were used to determine level of confidence of MOA assignment:  TYPE I = depressed locomotor activity with little or no response to outside stimuli, darkened body color, most fish dead by 24 h  TYPE II = hyperactive, usually overreactive to outside stimuli, death typically within several days of	Hyphens used in original database have been eliminated, e.g.,  TYPE I-ID converts to TYPE I ID  Abbreviations eliminated in v4a:  CONFLICT = conflicting information  EL = refers to tests conducted in electronic diluter systems  ID = insufficient data

		diluter system; Insufficient data; pH problem/	exposure  TYPE III = spontaneous locomotor activity, high incidence of convulsion, spasms, tetany, scoliosis, lordosis, and/or hemorrhaging in vertebral column  Additional notes provided to indicate problems in	PHPROB = indicates pH problem with study
			determining behavioral syndrome;  "blank" or null entry indicates no checklist completed for bioassay.	
Note_EPAFHM	memo	Text	Field used to provide supplementary Source-specific information pertaining to the chemical and toxicity fields.	EPAFHM-specific information pertaining to the chemical record previously included in <b>ChemicalNote</b> field has been moved to this field.
